

Offshore water solution

Photo of a system for UF filtration, (photo courtesy of LiqTech).

Stainless steel housings equipped with Back Pulse Hammer system.

The membranes are on the basis of revolutionary silicon carbide membrane technology and can be used for ultra and micro filtration of liquids.

The system is capable to treat flows like:

- **Concentrate flow from UF (inlet to RO-lines);**
- **Open Drains**
- **Bilge Water**
- **Produced water (treatment <5 mg/l)**

It is recommendable to install a Primary system (CPS and or hydro-cyclones) upfront of the Membrane UF system when heavy oil particles and sand are expected!!
